Arduino H/W

- ✓ CHAPTER 02. 아두이노
 - LESSON 01 아두이노 하드웨어
 - LESSON 02 아두이노 우노
- ✓ CHAPTER 03. 아두이노 메가 2560

Arduino ?

❖ Origin

- 2005년 Interaction Design Institute Ivrea (Italy)에서 예술가와 디자이너를 위한 μC 프로젝트로 시작

❖ Arduino

- **Hardware** (ATMEL사의 AVR 시리즈 마이크로컨트롤러)와
 - AVR - 1996년 ATMEL 사에서 개발한 Harvard Architecture의 8 bits RISC μC.
- CPU와 소용량 Flash Memory가 하나의 IC에 집적되어 있음
- **Software** (프로그램 개발을 위한 전용 라이브러리를 포함하는 개발 환경)를 함께 지칭

❖ Arduino H/W는 μC Board의 일종

- Arduino Board라고도 함
- 마이크로컨트롤러(AVR μC) + Connector + α
- Arduino의 Hardware와 Software는 모두 오픈 소스 정책에 따라 공개되어 있음
- 마이크로컨트롤러를 사용하여 만들어진 **개발** 보드
 - "개발 보드"와 실제 응용에서 쓰이는 "마이크로컨트롤러"는 구별할 필요가 있음
 - Arduino에는 μC 외에 많은 것들이 추가되어 있음

Arduino UNO

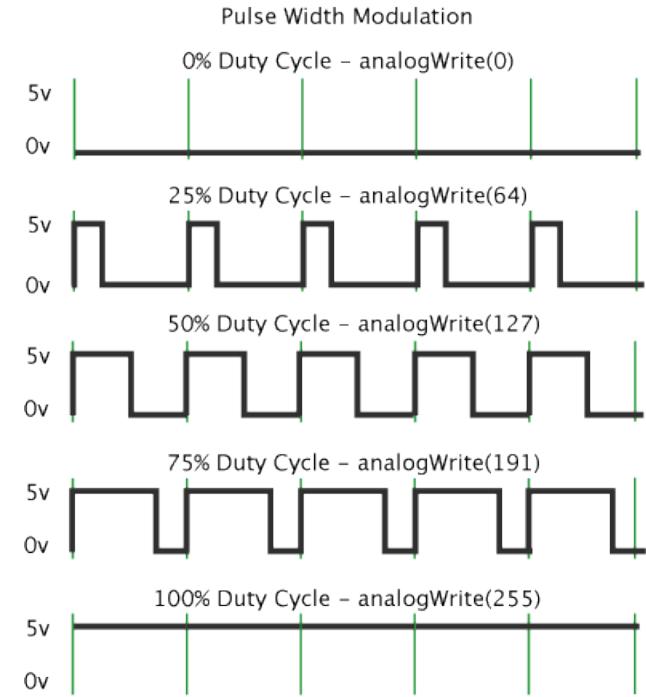

Arduino UNO

- ❖ Arduino Board 중 가장 기본이 되는 Board
- ❖ 8비트 CPU 포함: ATmega328
- ❖ 20개의 디지털 입출력 핀 사용 가능

- 0번에서 19번까지 핀 단위의 번호 지정
- 6개의 핀으로 PWM(Pulse Width Modulation) 신호 출력 가능
 - 3, 5, 6, 9, 10, 11번 핀

❖ 6개의 아날로그 입력 핀 사용 가능

- 14번에서 19번까지의 디지털 입력 핀과 동일
- 10비트 ADC (Analog to Digital Converter) 사용 (0~1023의 양자화된 값)
- DAC(Digital to Analog Converter)는 포함되어 있지 않으므로 **아날로그 값 출력은 불가능**

Arduino UNO 사양

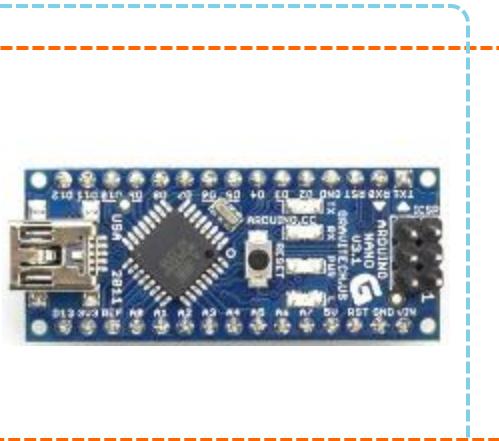

| 항목 | 내용 | 비고 |
|-----------|-----------|--|
| 마이크로컨트롤러 | ATmega328 | ATmega328P-PU |
| 동작 전압 | 5V | - |
| 입력 전압 | 7~12V | 추천 입력 범위 |
| 디지털 입출력 핀 | 14개 | 6개 PWM 출력 핀 (3, 5, 6, 9, 10, 11번 핀) |
| 아날로그 입력 핀 | 6개 | 14번에서 19번까지의 디지털 핀 |
| 플래시 메모리 | 32KB | ATmega328, 부트로더 0.5KB |
| SRAM | 2KB | ATmega328 |
| EEPROM | 1KB | ATmega328 |
| 클록 주파수 | 16MHz | - |

Arduino Board의 종류 - 핀 헤더 (Pin Header) 유무

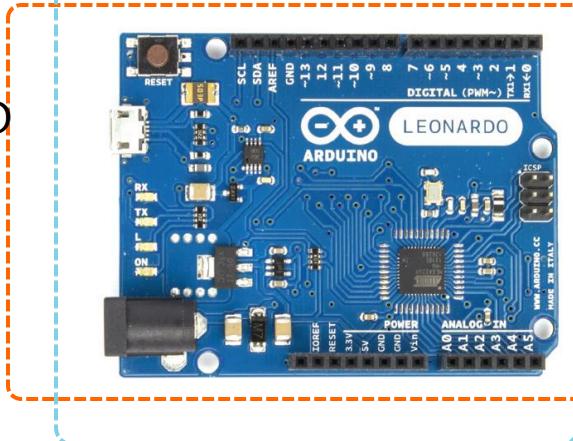

Arduino
UNO

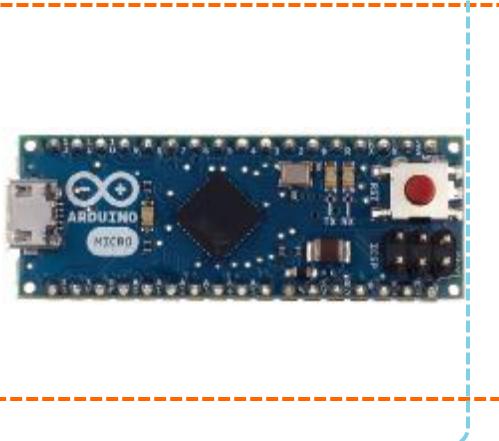

Arduino
Nano

Arduino
LEONARDO

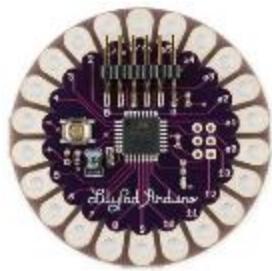

Arduino
Micro

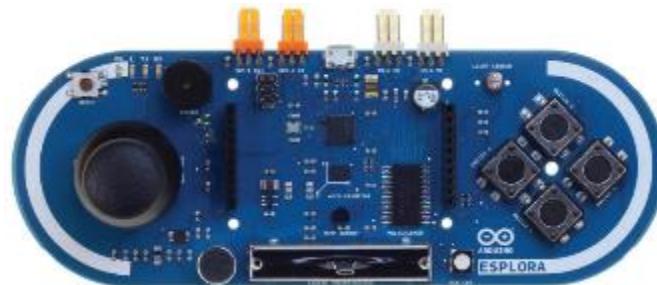

핀 헤더 있음 : 교육&개발

핀 헤더 없음 : 제품 적용

특수 목적용 Arduino Board

LILYPAD : Wearable

Esplora : Integrated sensors and actuators

Mega ADK :
For Android Accessory Development

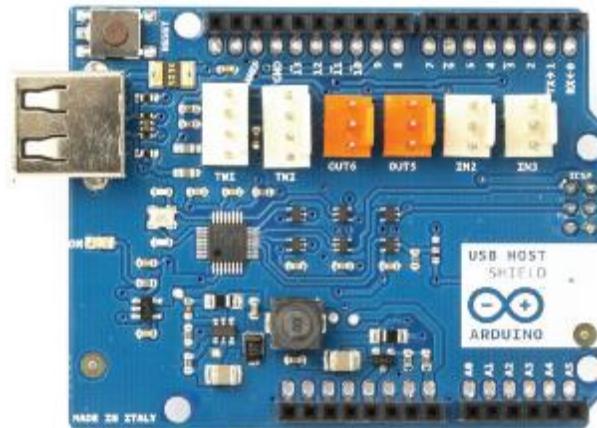

Arduino ROBOT (Retired)

Shield

- ❖ Arduino Board의 기능 확장을 위한 하드웨어
- ❖ 다양한 Arduino 공식 Shield 및 3rd party 업체의 호환 Shield 존재
 - 호환 Shield는 Arduino의 오픈 하드웨어 정책에 따라 가능

WiFi Shield

USB Host Shield

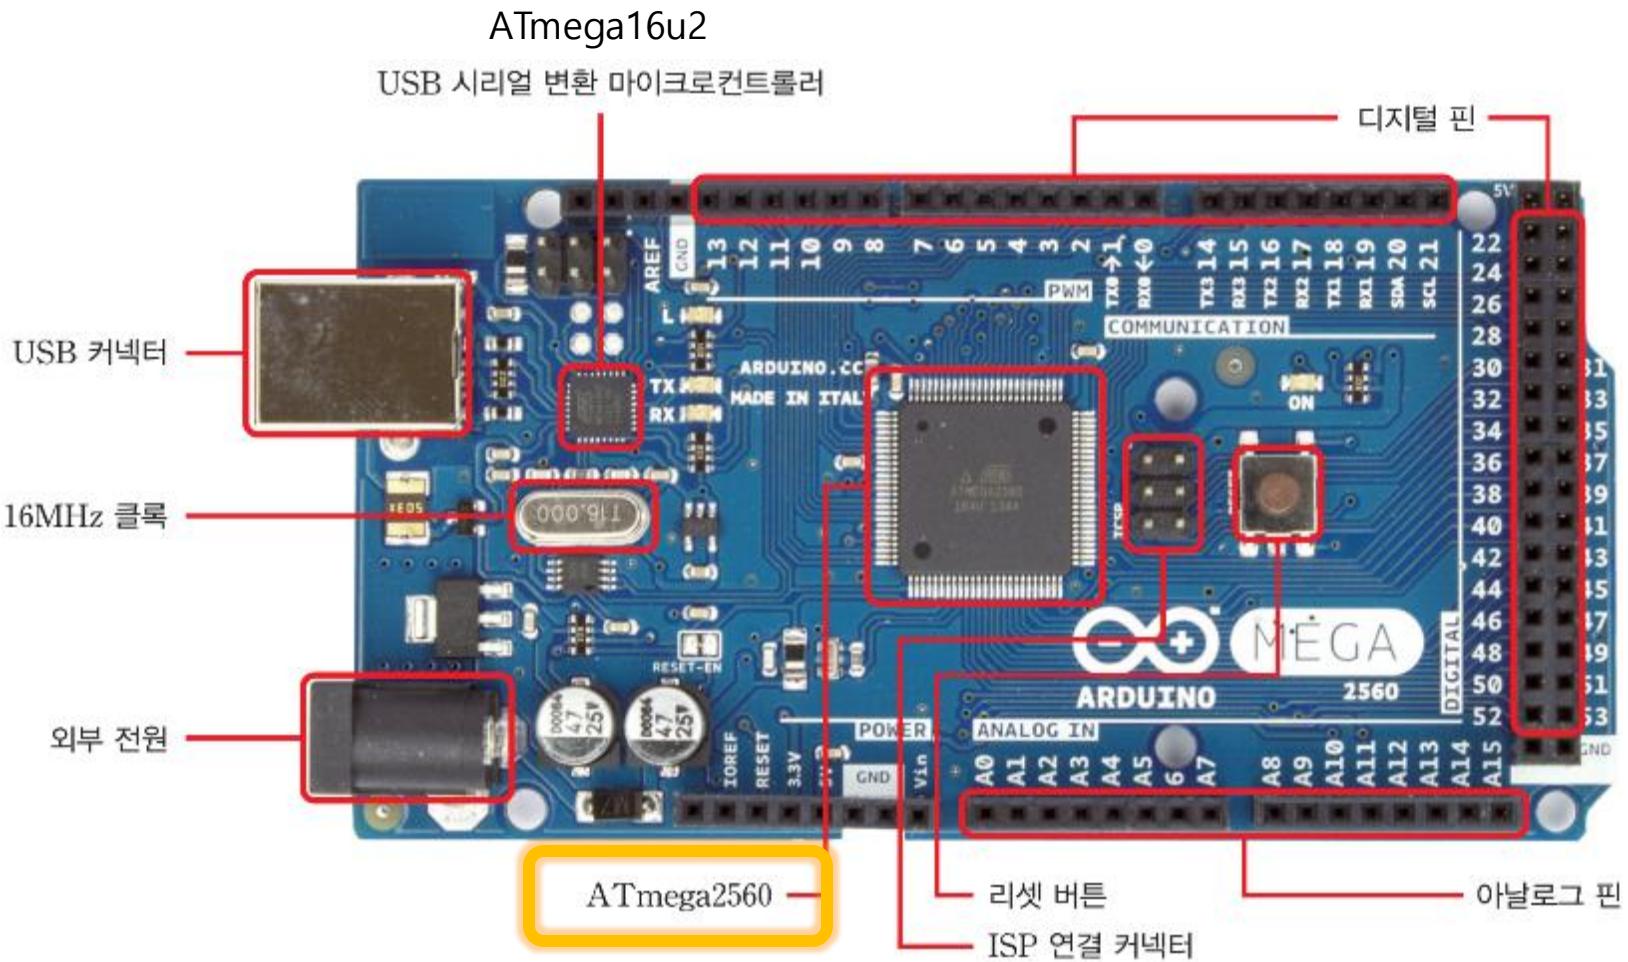

Arduino Board 종류 -μC의 종류

| Arduino | Microcontroller | Architecture | CPU bits |
|----------|-----------------|----------------|----------|
| Uno | ATmega328 | AVR | 8 |
| Leonardo | ATmega32u4 | AVR | 8 |
| Mega2560 | ATmega2560 | AVR | 8 |
| Zero | ATSAMD21G18 | ARM Cortex M0+ | 32 |
| Due | AT91SAM3X8E | ARM Cortex M3 | 32 |

AVR 기반 Arduino Board

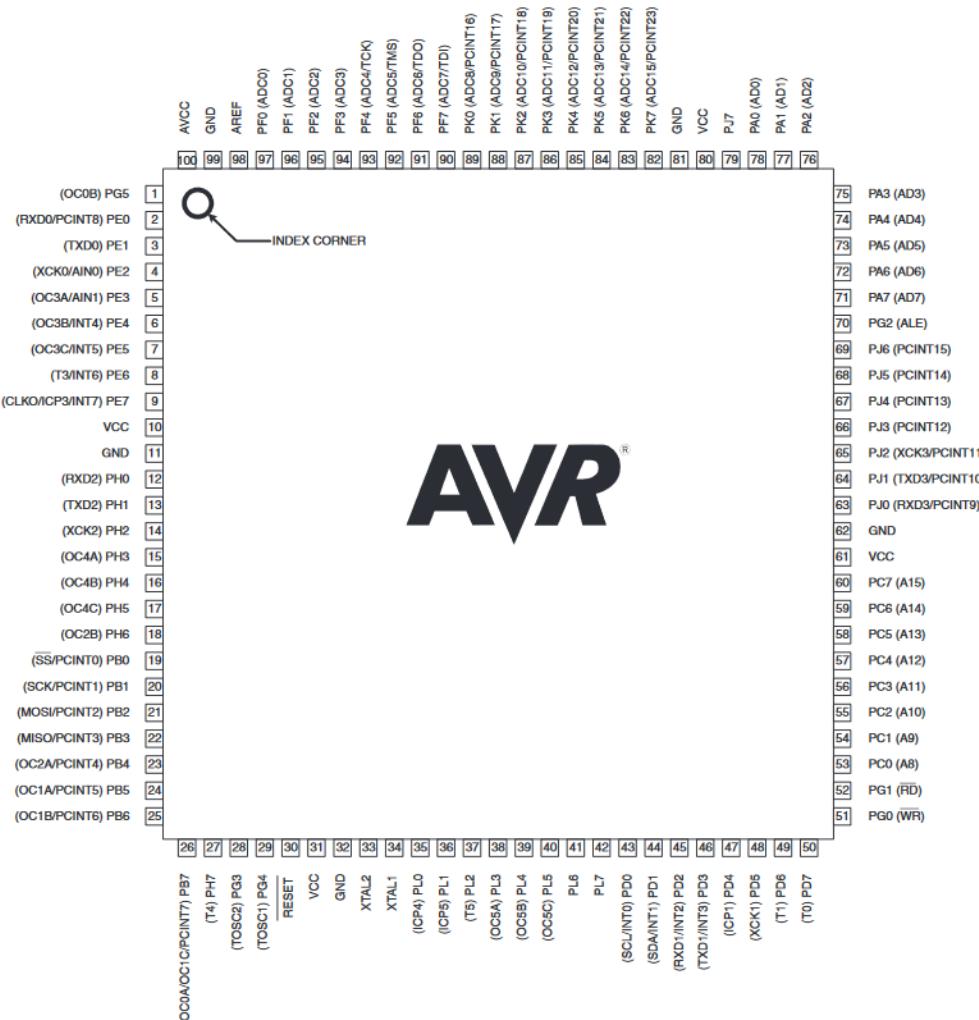

| 항목 | UNO | Leonardo | Mega2560 |
|-------------|-----------|------------|-------------------|
| uC | ATmega328 | ATmega32u4 | ATmega2560 |
| 클록 | 16MHz | 16MHz | 16MHz |
| 핀 수 | 28 | 44 | 100 |
| 디지털 입출력 핀 수 | 14 | 18(12) | 54 |
| 아날로그 입력 핀 수 | 6 | 6(12) | 16 |
| 입출력 핀 수 | 20 | 24 | 70 |
| PWM 채널 수 | 6 | 7 | 15 |
| 플래시 메모리 | 32KByte | 32KByte | 256KByte |
| SRAM | 2KByte | 2.5KByte | 8KByte |
| EEPROM | 1KByte | 1KByte | 4KByte |

Arduino Mega2560

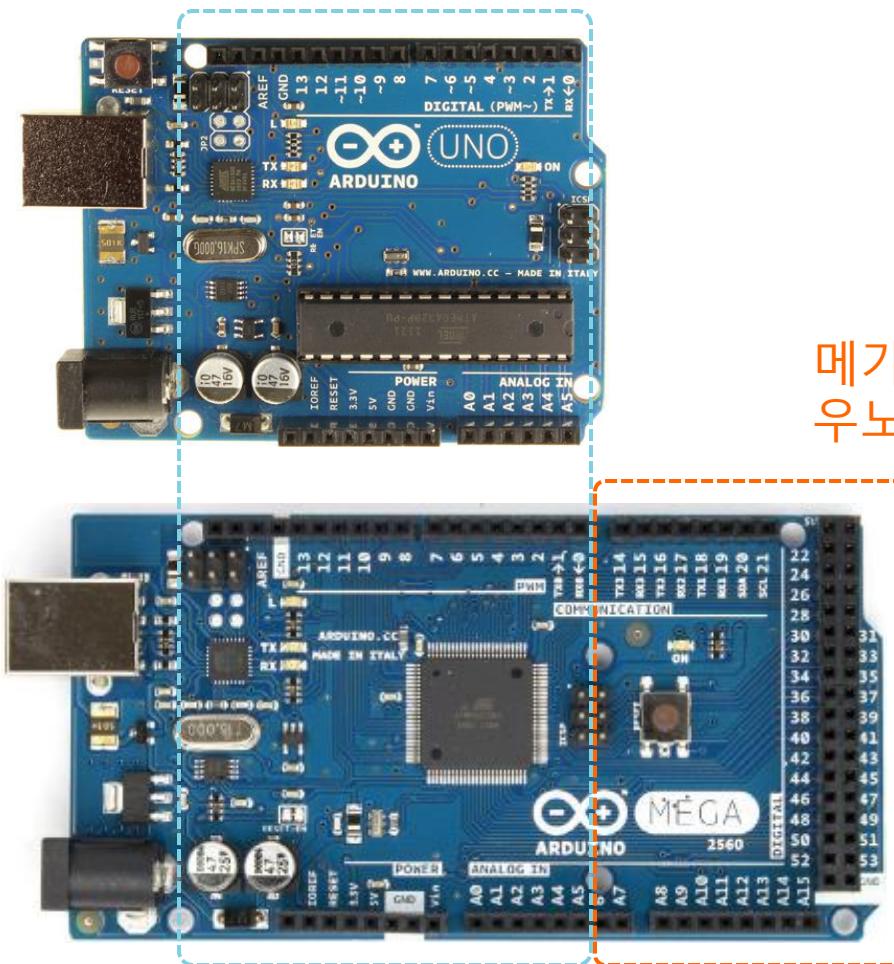

ATmega328 vs ATmega2560

| | | | |
|--------------------------|----|----|------------------------|
| (PCINT14/RESET) PC6 | 1 | 28 | PC5 (ADC5/SCL/PCINT13) |
| (PCINT16/RXD) PD0 | 2 | 27 | PC4 (ADC4/SDA/PCINT12) |
| (PCINT17/TXD) PD1 | 3 | 26 | PC3 (ADC3/PCINT11) |
| (PCINT18/INT0) PD2 | 4 | 25 | PC2 (ADC2/PCINT10) |
| (PCINT19/OC2B/INT1) PD3 | 5 | 24 | PC1 (ADC1/PCINT9) |
| (PCINT20/XCK/T0) PD4 | 6 | 23 | PC0 (ADC0/PCINT8) |
| VCC | 7 | 22 | GND |
| GND | 8 | 21 | AREF |
| (PCINT6/XTAL1/TOSC1) PB6 | 9 | 20 | AVCC |
| (PCINT7/XTAL2/TOSC2) PB7 | 10 | 19 | PB5 (SCK/PCINT5) |
| (PCINT21/OC0B/T1) PD5 | 11 | 18 | PB4 (MISO/PCINT4) |
| (PCINT22/OC0A/AIN0) PD6 | 12 | 17 | PB3 (MOSI/OC2A/PCINT3) |
| (PCINT23/AIN1) PD7 | 13 | 16 | PB2 (SS/OC1B/PCINT2) |
| (PCINT0/CLKO/ICP1) PB0 | 14 | 15 | PB1 (OC1A/PCINT1) |

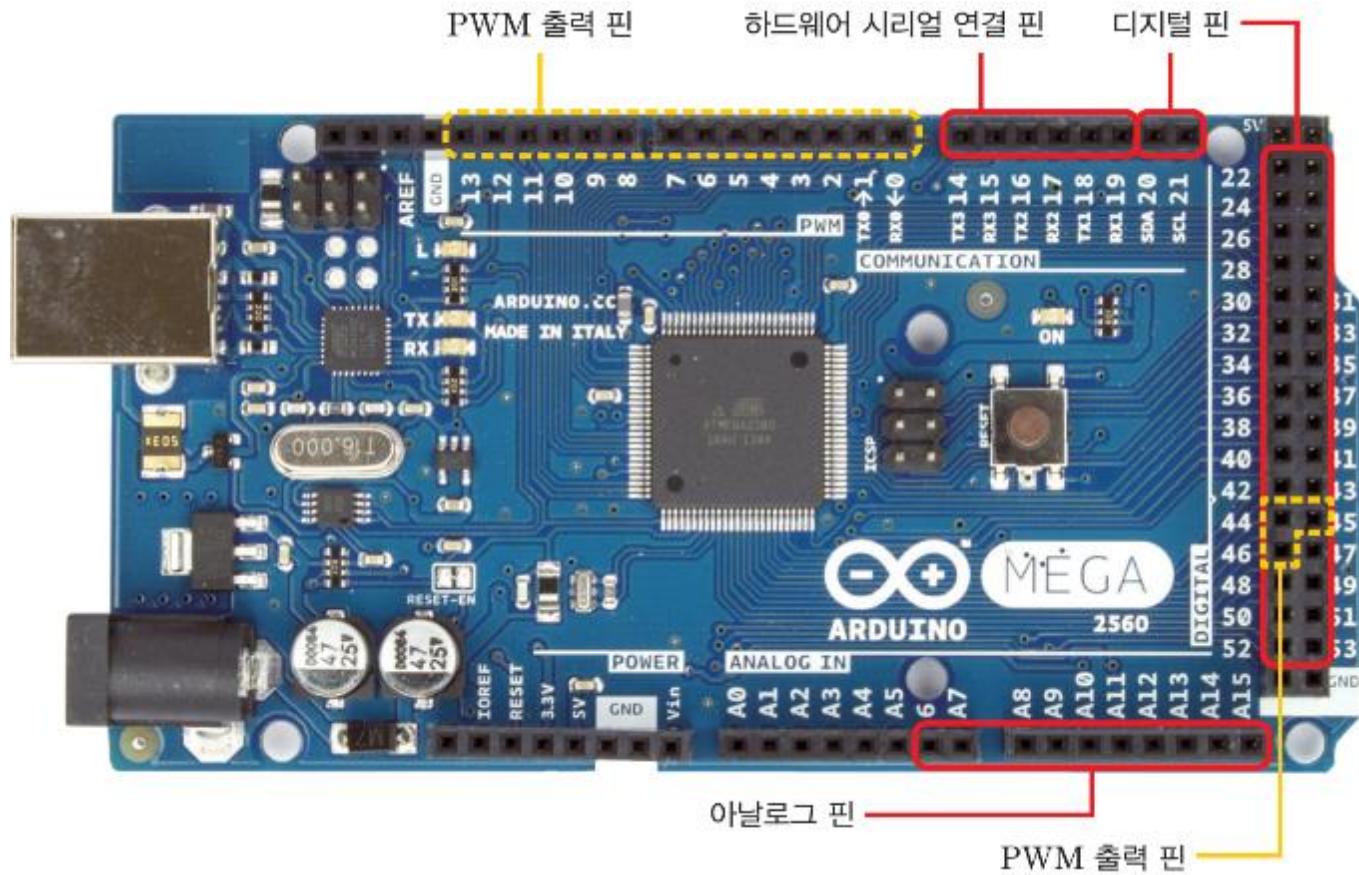

Arduino UNO vs. Mega2560

메가2560의 확장 핀 배열 :
우노에 비해 추가 기능 제공

동일한 핀 배열 : UNO, Mega2560 등에 공통으로 사용할 수 있는 "Shield" 제작 가능

Mega2560의 추가/변경 기능

* Arduino UNO 기준, Mega2560의 기능 추가 또는 변경

Arduino Mega2560

❖ Arduino UNO와 비교했을 때 더 많은 입출력 핀 사용

- 70개 핀(UNO는 20개 핀)을 디지털 입출력으로 사용 가능
- 16개 핀(UNO는 6개 핀)을 아날로그 입력으로 사용 가능
- 15개 핀(UNO는 6개 핀)을 PWM 출력으로 사용 가능
- 4개(UNO는 1개)의 UART 시리얼 통신 포트 사용 가능

❖ Arduino UNO와 비교했을 때 더 큰 메모리 사용 가능

- 256KB (UNO는 32KB) 크기의 플래시 메모리 사용 가능
- 8KB (UNO는 2KB) 크기의 SRAM 사용 가능
- 4KB (UNO는 1KB) 크기의 EEPROM 사용 가능

❖ 입출력 핀 수와 메모리 크기를 제외하면 UNO와 Mega2560은 기본적으로 동일한 특성을 가짐

맺는말

❖ Arduino UNO

- Arduino의 기본 보드
- 20개의 입출력 핀으로 연결할 수 있는 주변장치에 한계가 있음
- 32KB의 플래시 메모리로 복잡한 스케치(아두이노 프로그램) 작성에 한계가 있음

❖ Arduino Mega2560의 장점

- 70개의 많은 입출력 핀 : 다양한 주변장치를 한꺼번에 연결할 수 있음
- 256KB의 큰 플래시 메모리 : 크고 복잡한 스케치를 작성할 수 있음
- 따라서 다양한 주변장치를 연결하여 학습용으로 사용하기에 적합

Arduino S/W & Programming

✓ CHAPTER 02. 아두이노

LESSON 03 아두이노 소프트웨어

LESSON 04 아두이노 프로그래밍

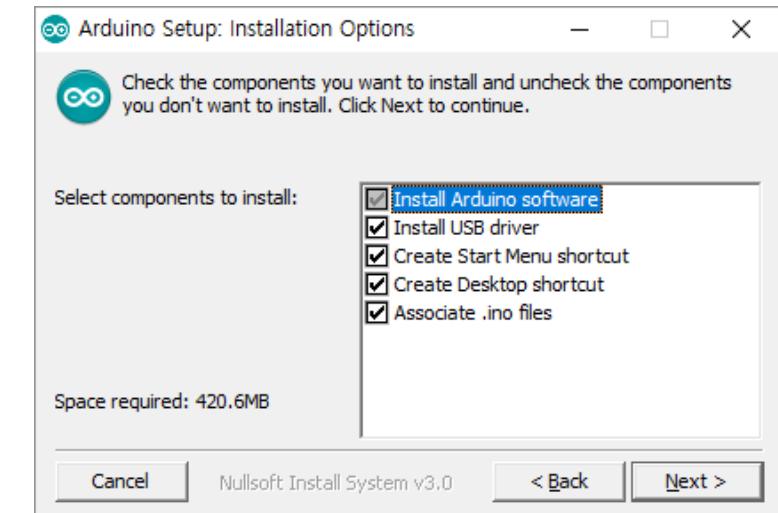

LESSON 05 아두이노 스케치 구조

Arduino IDE Installation and Practice

❖ Experiment Sequence

- ① Download the Arduino IDE (Integrated Development Environment):
www.arduino.cc
- ② Run Installer
- ③ Specify a Destination Folder
- ④ Install Arduino Board Driver (Automatically proceeded by the Installer)
- ⑤ Connect Arduino Board to PC and Run IDE
- ⑥ Open Example Codes (Blink, ASCIITable)
- ⑦ IDE Preference Setup
- ⑧ Cross Compile & Upload
- ⑨ Check the Result

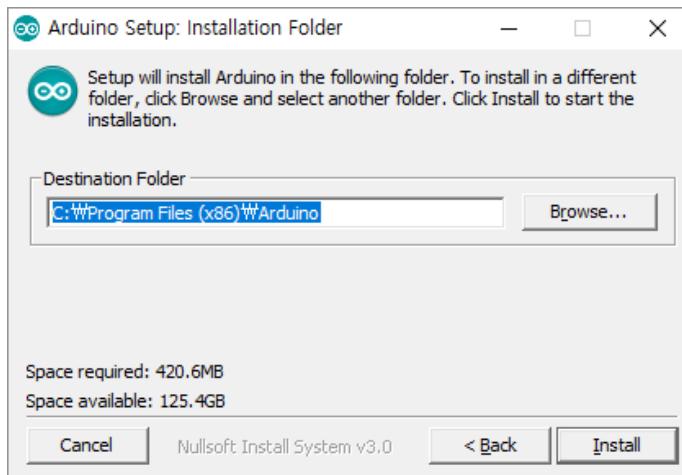

①, ② Download and Install Arduino IDE

① Download IDE : www.arduino.cc

② Run Installer

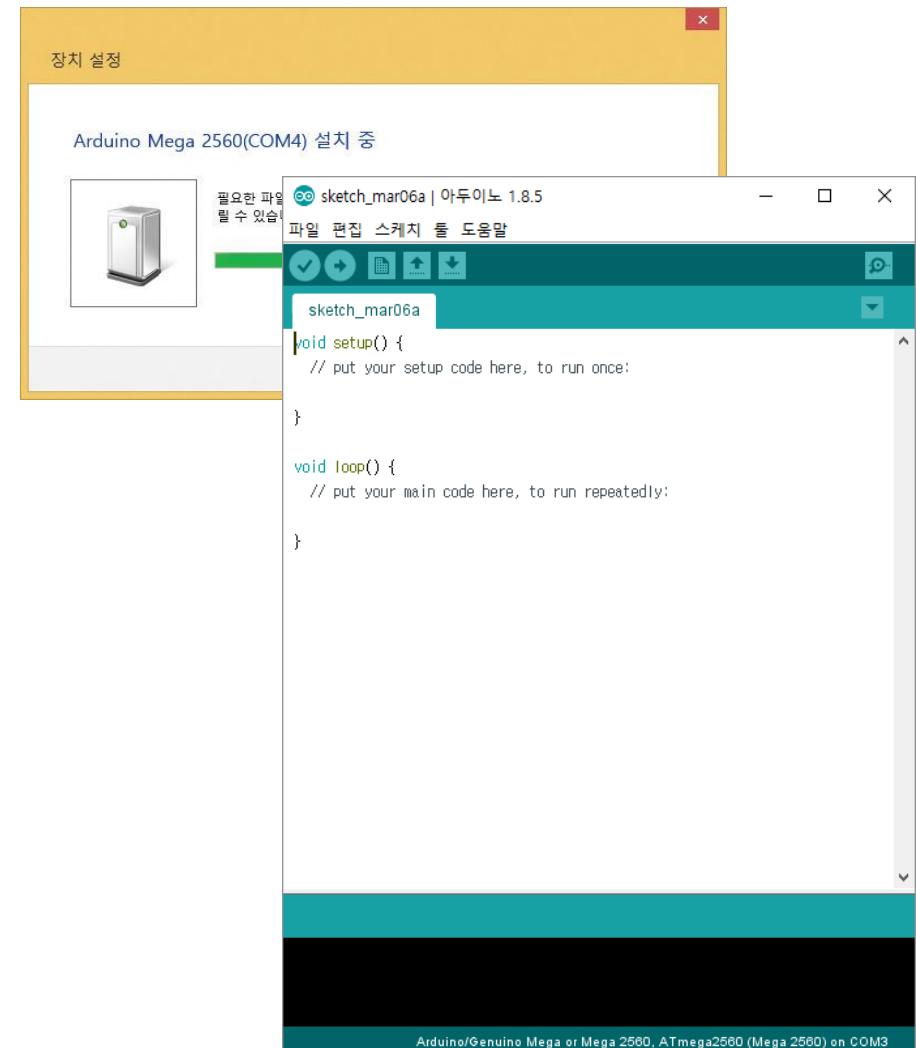

③~⑤ Arduino IDE Installation and Execution

③ Specify a destination folder

④ Install an Arduino driver

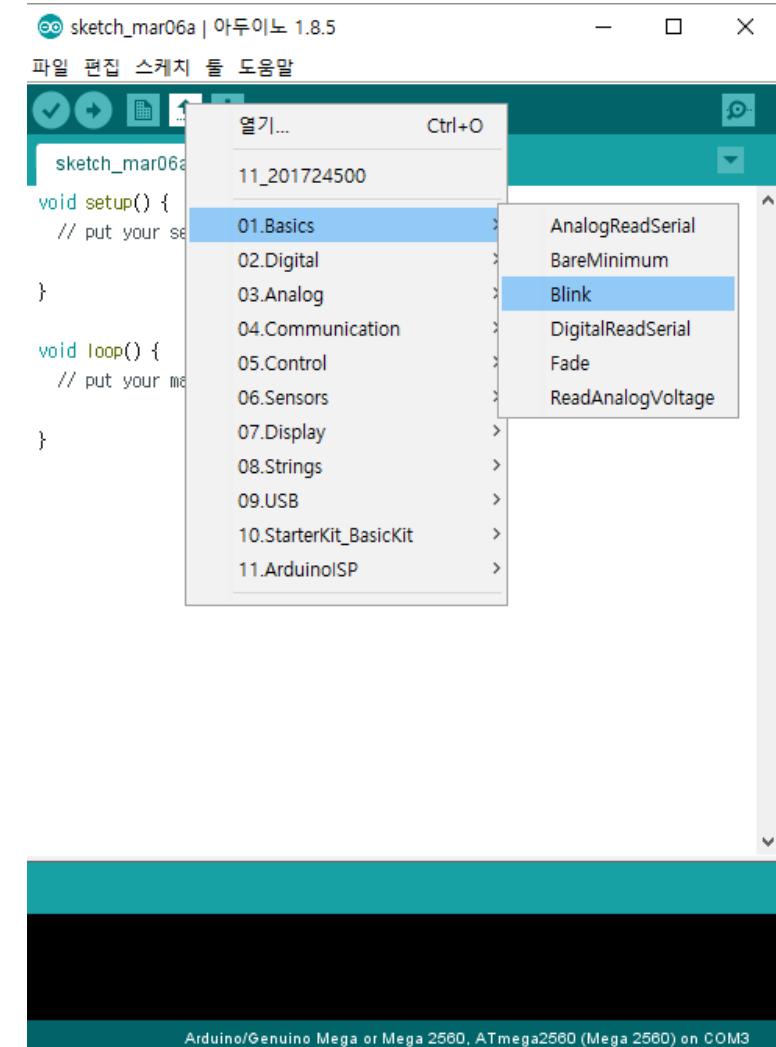

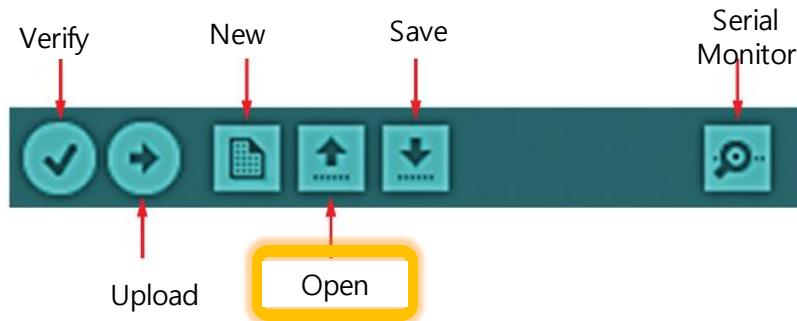

⑤ Connect Arduino board and run IDE : setup COM port

⑥ Open Example Codes (Blink)

❖ Click “Open” in IDE Toolbar

- or click “File > Examples” in menu bar

❖ Examples

- 01.Basics -> Blink
 - Example code for the first practice
- 04.Communications -> ASCIITable
 - Example code for the second practice

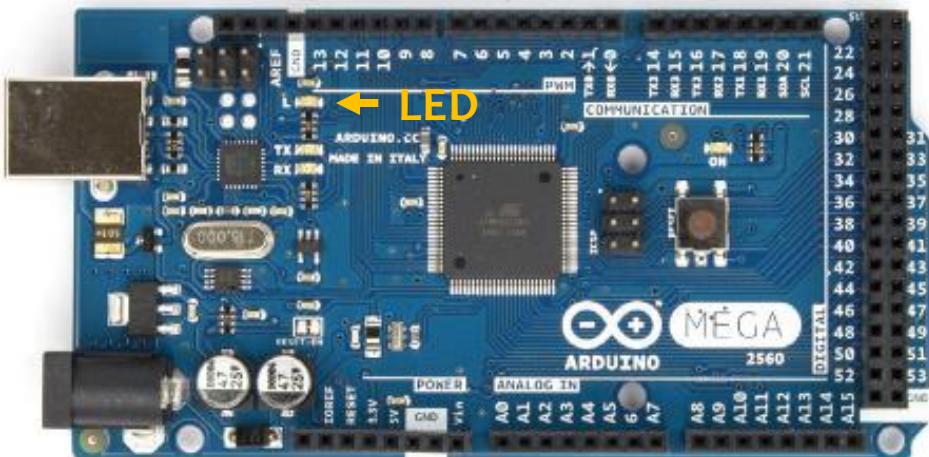

Blink Sketch

❖ Sketch

- A Sketch is the name of an Arduino program because it is very easy to write just like drawing

❖ Blink Sketch

- This sketch blinks an LED connected to digital pin 13 with 1000ms (=1 sec) interval.
- 'Hello World' of Arduino programming

Blink | 아두이노 1.8.5

파일 편집 스케치 둘 도움말

Blink

by mrauch_arduinoAPI
modified 8 Sep 2016
by Colby Newman

This example code is in the public domain.

<http://www.arduino.cc/en/Tutorial/Blink>

```
/*
// the setup function runs once when you press reset or power the board
void setup() {
    // initialize digital pin LED_BUILTIN as an output.
    pinMode(LED_BUILTIN, OUTPUT);
}

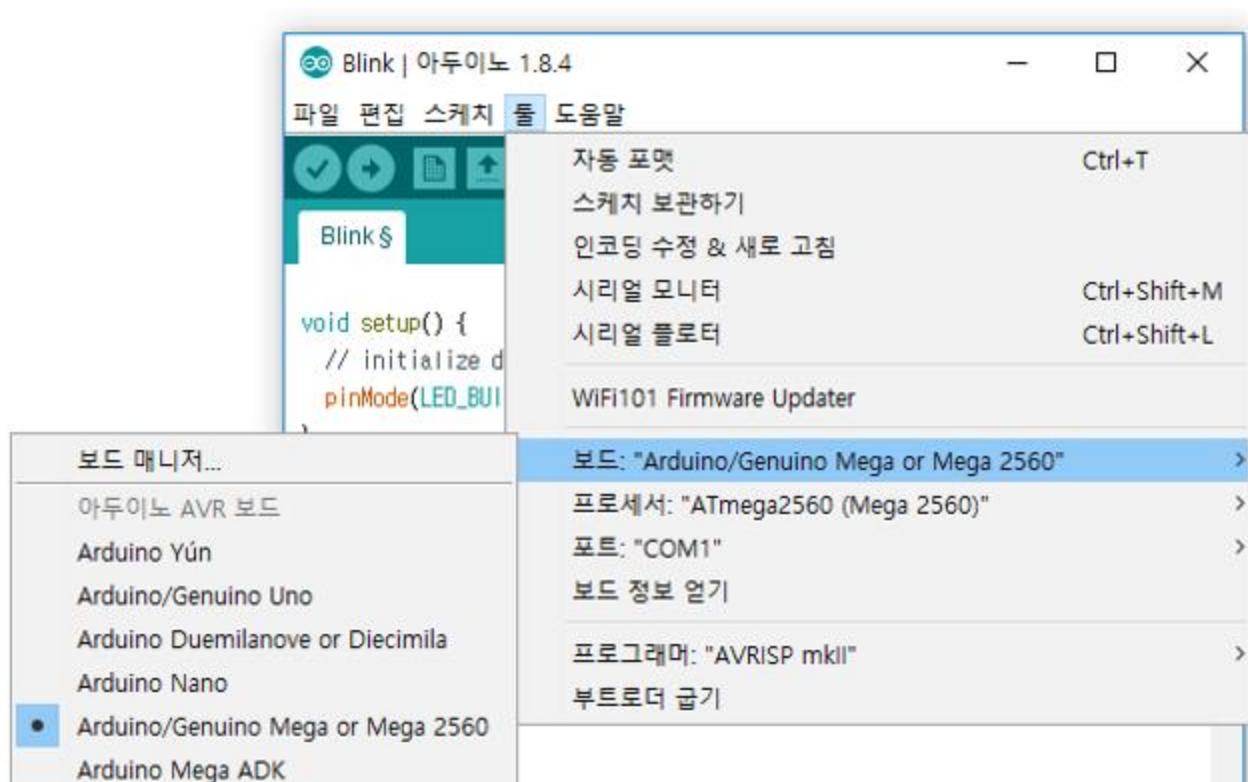

// the loop function runs over and over again forever
void loop() {
    digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)
    delay(1000); // wait for a second
    digitalWrite(LED_BUILTIN, LOW); // turn the LED off by making the voltage level
    delay(1000); // wait for a second
}
```

자동 포맷을 위해 변경이 필요있습니다.

⑦ IDE Preference Setup - Board

❖ Board Selection

- Setup a type of board which you are using
- Select ‘Arduino/Genuino Mega or Mega 2560’ in ‘Tools → Board’ menu

⑦ IDE Preference Setup - Processor

❖ Processor Selection

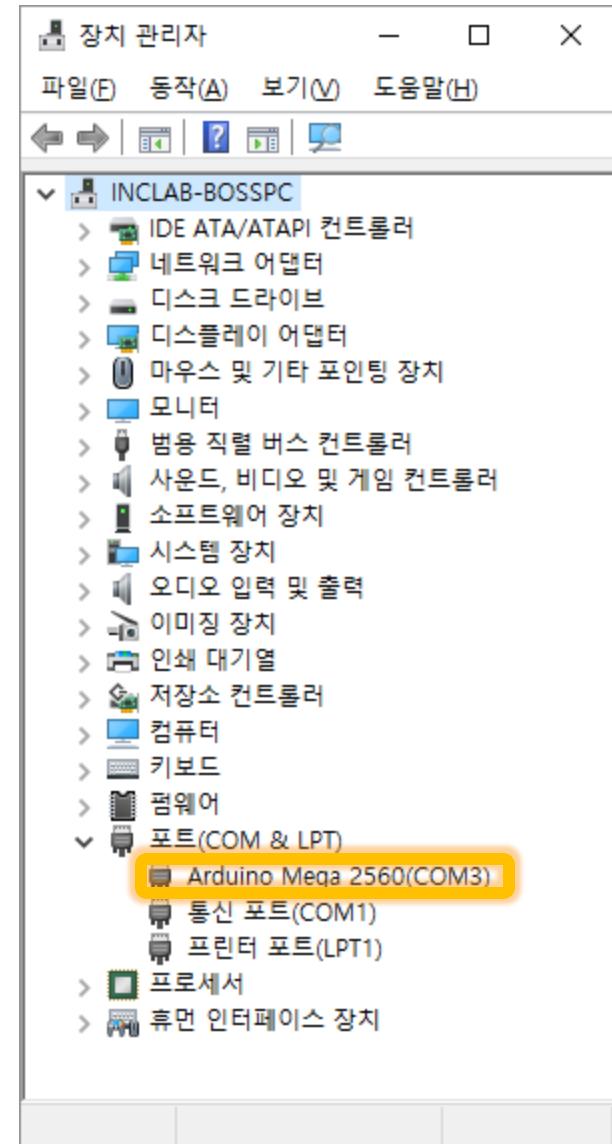

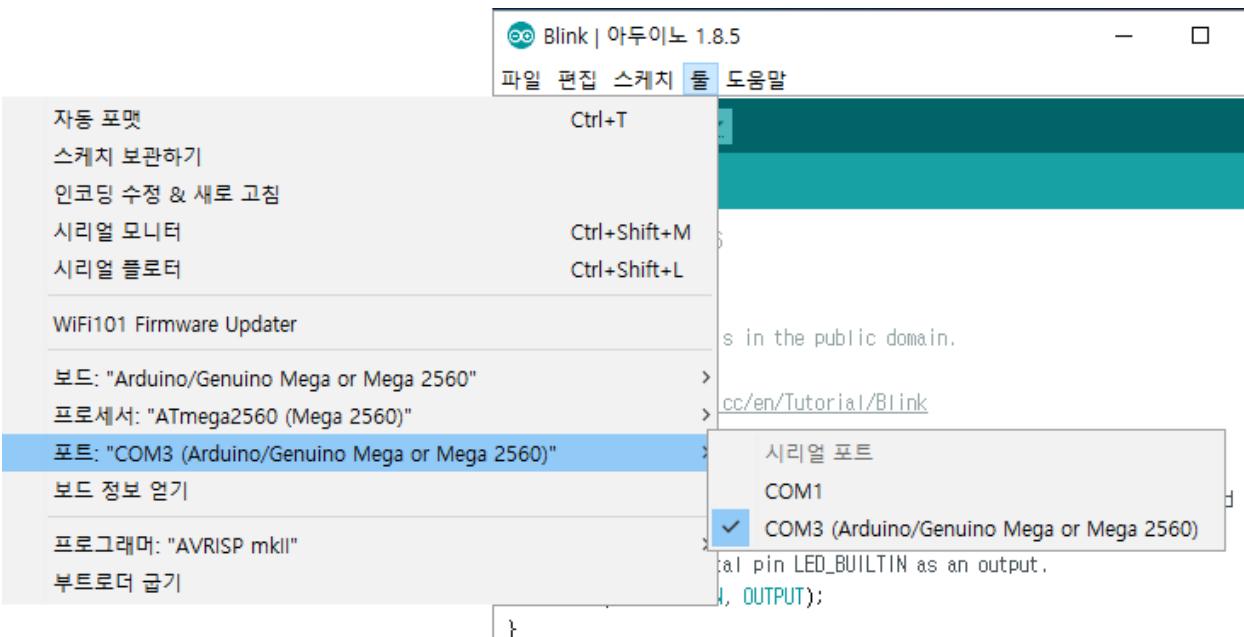

- Select the type of an µC which is used by the current Arduino board
- Select ‘ATmega2560’ in ‘Tools → Processor’ menu

⑦ IDE Preference Setup - Port

❖ Port Selection

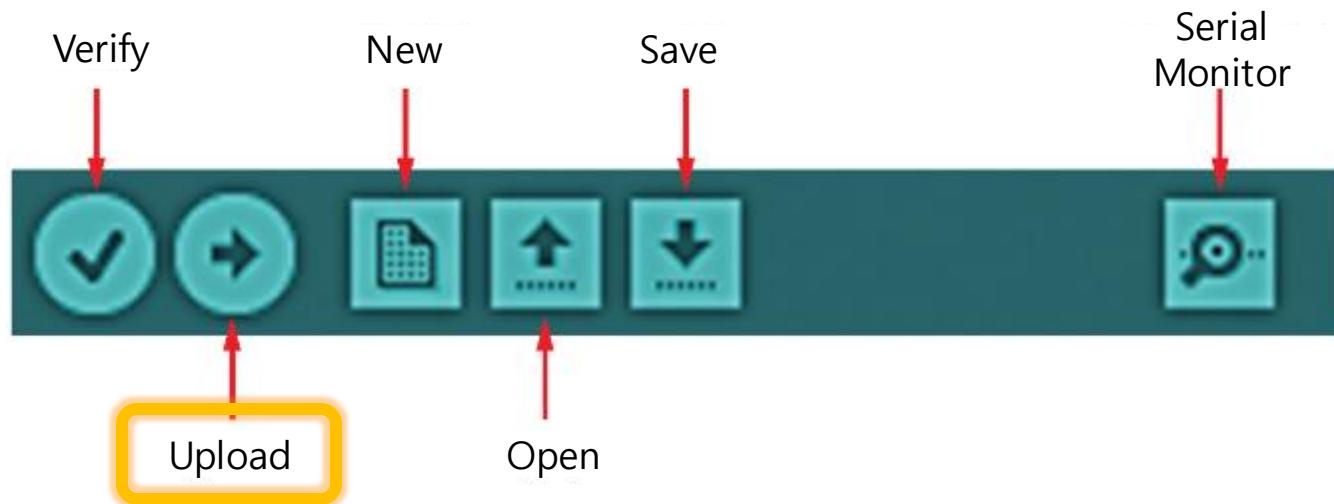

- Setup the virtual COM port assigned to the Arduino
- Select the port in ‘Tools → Port’ menu
- Verify which port is assigned to Arduino board in “Device Manager”

⑧ Cross Compile & Upload

❖ Toolbar

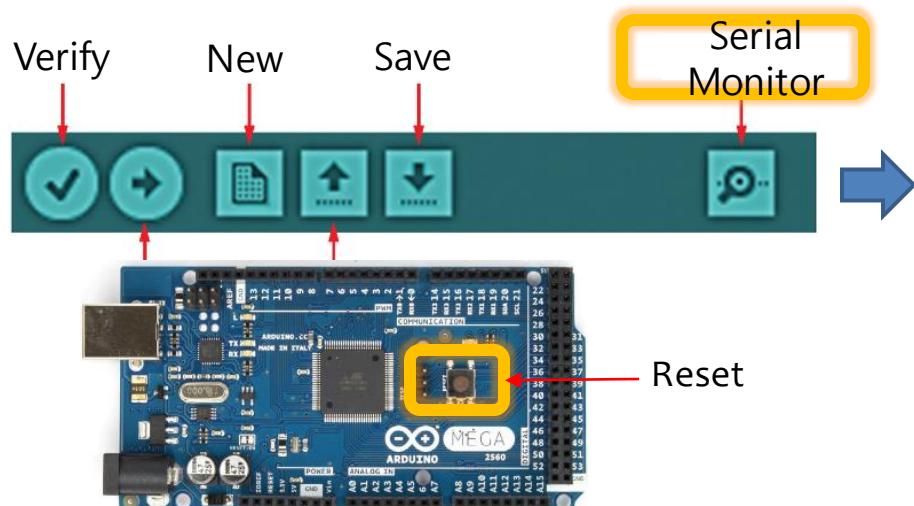

- Verify : Sketch (Cross) Compile
- Upload : Compile a Sketch (Cross) and upload a produced execution code
→ Just one click for both compile and upload
- Serial Monitor : Executing the program for serial communication between Arduino and PC

⑨ Check the Result

- ❖ Ex. 1 Check the LED blinking
- ❖ Ex. 2 Compile and Upload ASCIITable example

- ASCIITable Sketch – Print out ASCII characters to serial port
 - Check the output of the Sketch on the Serial Monitor
- Serial Port : A communication channel between Arduino and PC
 - For program uploading : PC → Arduino
 - Serial port can be used for communication from Arduino to PC and vice a versa
 - The information sent by Arduino is printed out on ‘Serial Monitor’
- Ref.– Re-execution ASCIITable Sketch
 - Push the Reset button on the board

```

ASCII Table ~ Character Map
1, dec: 33, hex: 21, oct: 41, bin: 100001
", dec: 34, hex: 22, oct: 42, bin: 100010
#, dec: 35, hex: 23, oct: 43, bin: 100011
$, dec: 36, hex: 24, oct: 44, bin: 100100

3, dec: 51, hex: 33, oct: 63, bin: 100011
4, dec: 52, hex: 34, oct: 64, bin: 100100
5, dec: 53, hex: 35, oct: 65, bin: 100101
6, dec: 54, hex: 36, oct: 66, bin: 100110
7, dec: 55, hex: 37, oct: 67, bin: 100111

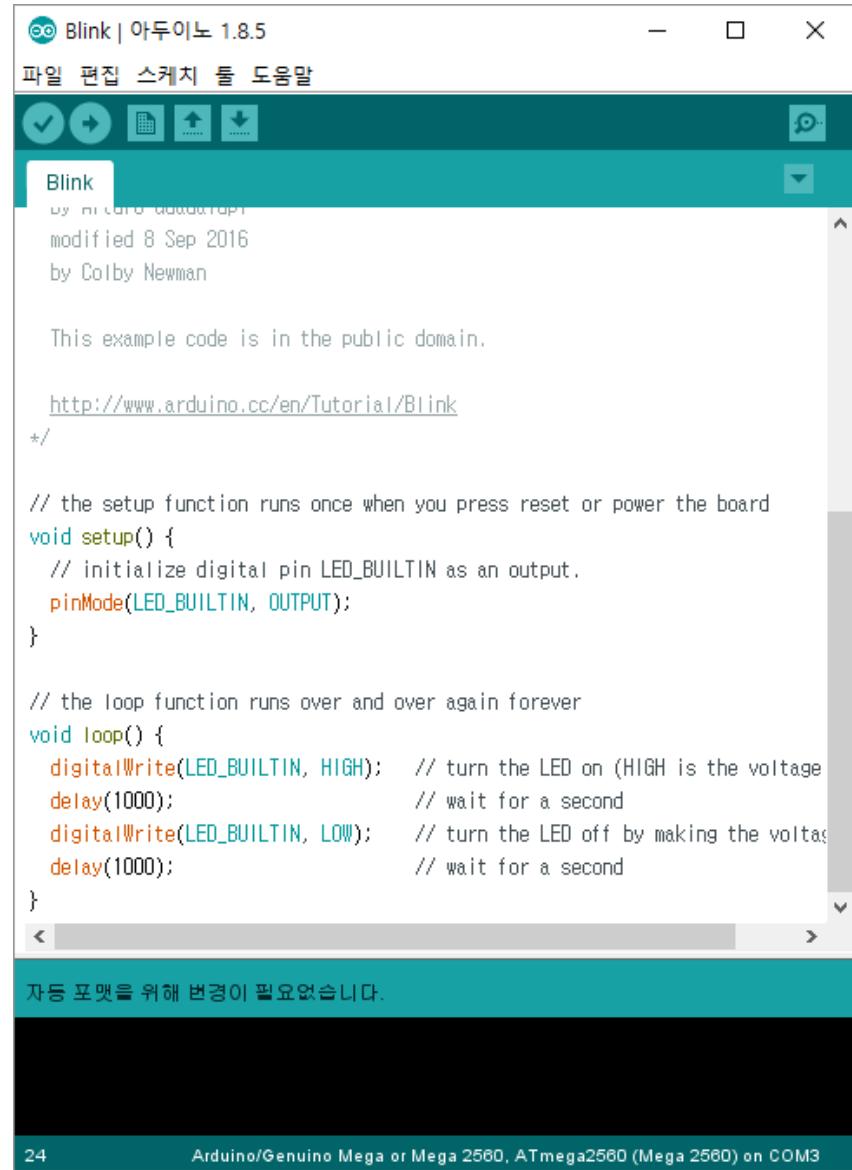

```

At the bottom of the window, there are checkboxes for '자동 스크롤' (Auto scroll), 'line ending 없음' (No line ending), '9600 보드레이트' (9600 baud rate), and '출력 지우기' (Clear output).

After the completion of the experiments, you have to get confirmation by TA and submit the score result on PLATO LAB 2-1

Arduino IDE

- ❖ 작고 간단한 통합개발환경/IDE
- ❖ 초보자를 위해 꼭 필요한 기능들만으로 구성
- ❖ 한번의 클릭으로 Compile에서 Upload까지 진행
- ❖ Java로 구현되어 OS 간 이식성(Portability)이 뛰어남
- ❖ Debugging 기능은 제공하지 않음

The screenshot shows the Arduino IDE interface with the 'Blink' example sketch loaded. The title bar reads 'Blink | 아두이노 1.8.5'. The menu bar includes '파일', '편집', '스케치', '툴', and '도움말'. Below the menu is a toolbar with icons for file operations. The code editor displays the following code:

```
/*
 * Blink
 * by microcontrollerapi
 * modified 8 Sep 2016
 * by Colby Newman
 *
 * This example code is in the public domain.
 *
 * http://www.arduino.cc/en/Tutorial/Blink
 */
void setup() {
    // initialize digital pin LED_BUILTIN as an output.
    pinMode(LED_BUILTIN, OUTPUT);
}

void loop() {
    digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)
    delay(1000); // wait for a second
    digitalWrite(LED_BUILTIN, LOW); // turn the LED off by making the voltage
    delay(1000); // wait for a second
}
```

A status bar at the bottom says '자동 포맷을 위해 변경이 필요있습니다.' (Automatic format required). The footer of the IDE window shows '24' and 'Arduino/Genuino Mega or Mega 2560, ATmega2560 (Mega 2560) on COM3'.

Arduino SW 장점 - 추상화된 함수

- ❖ 서로 다른 μC를 사용한 Arduino 보드를 동일한 코드로 동일한 동작을 구현할 수 있도록 해 줌

ATmega2560의 Blink

```
DDRB |= 0x80;  
PORTB |= 0x80;
```

ATmega328의 Blink

```
DDRB |= 0x20;  
PORTB |= 0x20;
```

Arduino Mega2560과 Arduino UNO의 Blink

```
pinMode(13, OUTPUT);  
digitalWrite(13, HIGH);
```

AVR 스타일 : μC에 따라
약간씩 차이가 있음

Arduino Style : 모든 Arduino
Board에서 동일함

Sketch의 구조

❖ μC의 프로그램

- 일반 컴퓨터와 달리 **오직 하나의 프로그램**만 설치
- 설치된 프로그램은 **전원이 주어지는 동안 끝나지 않는 무한 루프**를 통해 동작

❖ Arduino Sketch Programming Language: C/C++ 기반

❖ Sketch 구조 : 2개의 기본 함수로 구성

- 직관적 프로그래밍을 위해 main 함수 없이 setup(), loop() 두 함수로 구성
 - 실제 main 함수는 숨겨져 있으며 Sketch 개발자는 신경 쓰지 않아도 됨
- **Setup** 함수
 - 초기화 함수
 - 스케치 실행이 시작될 때 한 번만 실행
- **loop** 함수
 - 반복 실행 함수
 - μC를 위한 프로그램에서 메인/이벤트 루프에 해당

Sketch의 구조 비교

전처리

```
int main(void)  
{
```

초기화

```
    while(1)  
    {
```

데이터 처리

```
    }
```

```
    return 1;
```

```
}
```

μC를 위한 프로그램의 구조

전처리

```
void setup(void)  
{
```

초기화

```
}
```

```
void loop(void)  
{
```

데이터 처리

```
}
```

Arduino를 위한 Sketch의 구조

Main.cpp

```
#include <Arduino.h>

int main(void)
{
    init();

    initVariant();

#if defined(USBCON)
    USBDevice.attach();
#endif

    setup();

    for (;;) {
        loop();
        if (serialEventRun) serialEventRun();
    }

    return 0;
}
```

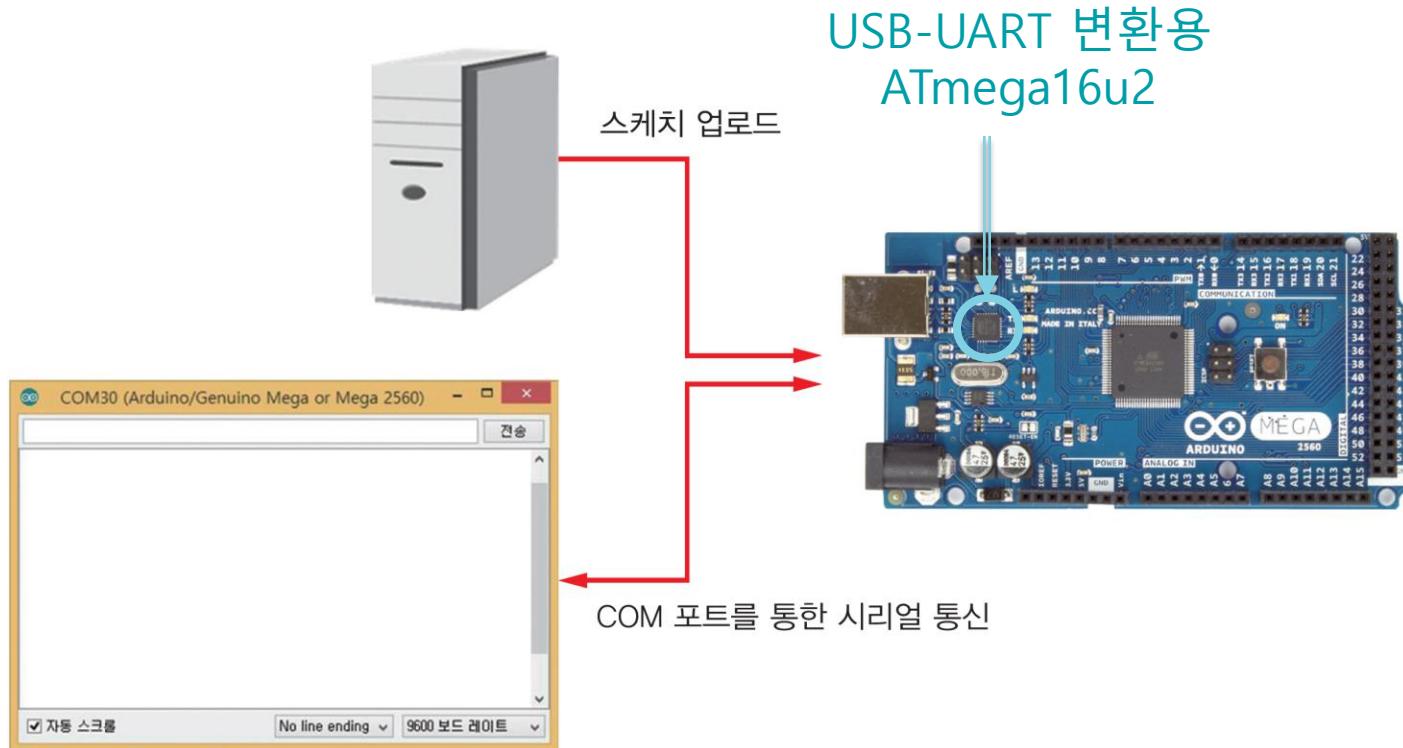

Arduino Serial Class

- ✓ CHAPTER 04. 아두이노 기본 클래스
 - LESSON 01 아두이노 라이브러리
 - LESSON 02 시리얼 통신
 - LESSON 03 Serial 클래스

Arduino와 컴퓨터의 연결 - UART Serial 통신

- ① 스케치 업로드를 위해 사용
- ② (양방향) Serial 통신을 위해 사용

Arduino UART Serial 통신

❖ Universal Asynchronous Receiver/Transmitter

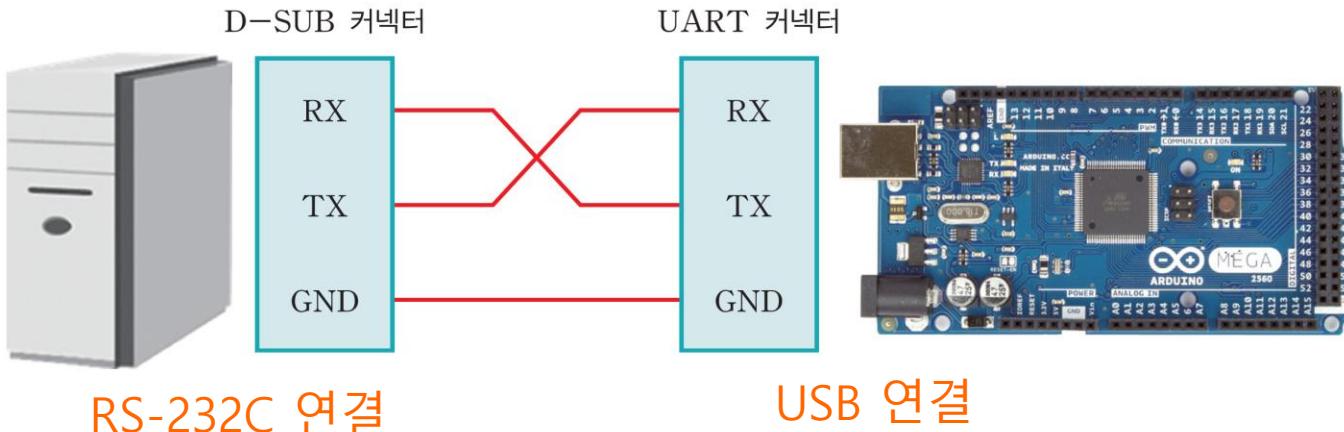

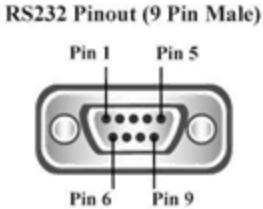

- Universal : RS-232C, RS-422, RS-485 등 다양한 통신 프로토콜에 쓰이는 범용 통신 기술
- Asynchronous : 비동기 → 동기화를 위한 별도의 Clock을 사용하지 않음
- 하드웨어 수준에서 지원하는 저수준 통신 기술

❖ Arduino UART Serial 통신

- RS-232C프로토콜 중 RX, TX, GND의 세 개의 Pin 만을 사용
- TX와 RX 교차 연결

RS232

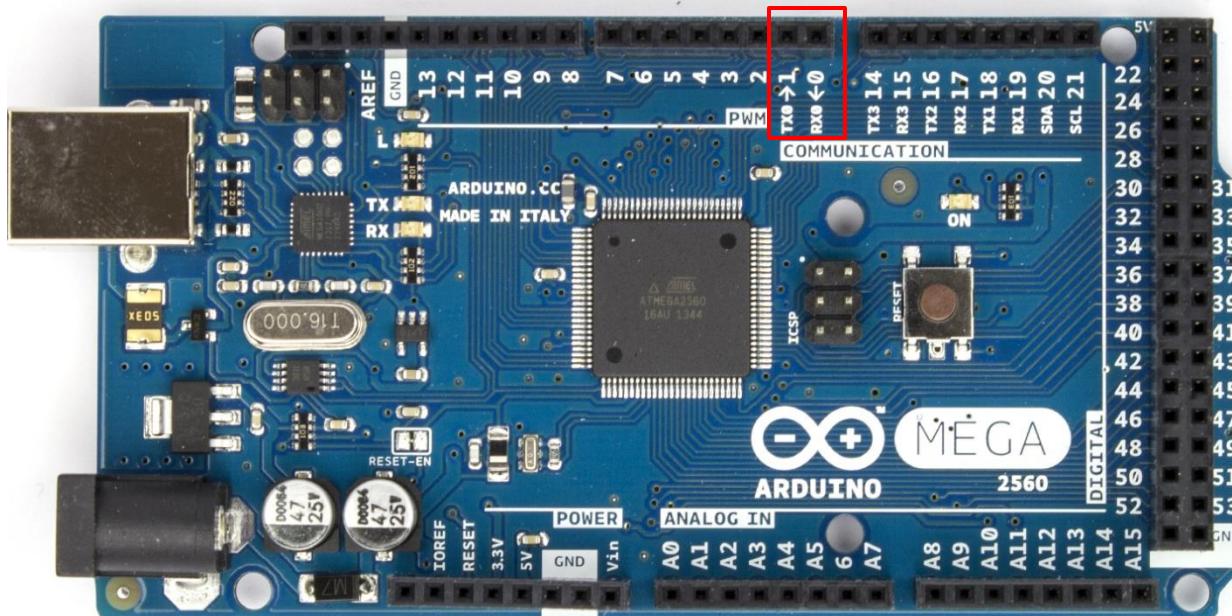

| Pin 1 | DCD |
|-------|-----|
| Pin 2 | RXD |
| Pin 3 | TXD |
| Pin 4 | DTR |
| Pin 5 | GND |
| Pin 6 | DSR |
| Pin 7 | RTS |
| Pin 8 | CTS |
| Pin 9 | RI |

Arduino UART Serial 통신

❖ Arduino 보드와 컴퓨터의 통신은 USB로 이루어짐

- Arduino 보드의 ATmega16u2 컨트롤러가 USB와 UART 사이의 변환을 담당
- Mega2560의 0번 UART 채널 사용
- 0번 UART 채널에 해당하는 Serial 객체를 통해 USB를 통한 컴퓨터와의 시리얼 통신 수행

Arduino Serial Class

❖ UART Serial Class

- Sketch 작성에서 일반적으로 쓰이는 UART Serial 통신을 위한 Class
- 별도의 헤더 파일 (*.h) include 없이 바로 사용할 수 있는 Arduino 기본 Class

❖ 실제 Class 이름은 **Serial**_이며, 그 객체가 **Serial**임

- UNO는 하나의 UART Serial 통신 포트만을 제공하는 반면, Mega2560은 4개의 UART Serial 통신 포트를 제공
- Mega2560은 4개의 UART Serial 통신 포트를 위해 **Serial**, **Serial1**, **Serial2**, **Serial3**의 전용 객체가 미리 정의되어 생성되어 있음
 - **Serial**_Class에서 직접 객체를 생성하여 사용하는 경우는 없음

| 채널 | 연결 핀 | 해당 객체 | 설명 |
|----|----------------|---------|---------|
| 0 | 0(RX), 1(TX) | Serial | UNO와 동일 |
| 1 | 19(RX), 18(TX) | Serial1 | |
| 2 | 17(RX), 16(TX) | Serial2 | |
| 3 | 15(RX), 14(TX) | Serial3 | |

OOP & C++ Class 사용법

❖ 객체지향프로그래밍(Object Oriented Programming: OOP)

- 프로그램을 데이터와 처리 방법으로 나누는 것이 아니라 수 많은 "객체(Object)"로 나누고 객체간의 상호 작용으로 프로그램을 기술하는 방법
- 객체는 속성(Attribute/member variable)과 함수(Method/member function)를 가짐

❖ C++ Class Example

- Class와 (class/object) instance : Ex) Class – 사람, Instance – 김영미
- object instance에 .을 덧붙여 method를 호출하거나 attributes에 접근

```
class Rectangle{  
    int width;  
    int height;  
  
    void draw(void);  
    int area (void);  
}
```

Class Name

Attributes
Member Variable

Method
Member function

```
Rectangle rect;
```

```
rect.width = 5;  
rect.height = 4;
```

```
rect.draw();
```

Arduino Serial Class

❖ Arduino Reference → <https://www.arduino.cc/reference/en/>

❖ Arduino Serial Class Reference

- <https://www.arduino.cc/reference/en/language/functions/communication/serial/>
- Serial Class가 제공하는 전체 Methods / Member Functions 
 - [If \(Serial\)](#)
 - [available\(\)](#)
 - [availableForWrite\(\)](#)
 - [begin\(\)](#)
 - [end\(\)](#)
 - [find\(\)](#)
 - [findUntil\(\)](#)
 - [flush\(\)](#)
 - [parseFloat\(\)](#)
 - [parseInt\(\)](#)
 - [peek\(\)](#)
 - [print\(\)](#)
 - [println\(\)](#)
 - [read\(\)](#)
 - [readBytes\(\)](#)
 - [readBytesUntil\(\)](#)
 - [setTimeout\(\)](#)
 - [write\(\)](#)
 - [serialEvent\(\)](#)
- begin() 함수는 무슨 역할을 할까?
- 데이터 출력을 위해 print(), println(), write()
- 데이터 입력을 위해 available(), peek(), read() 함수를
- 실습을 통해 사용해 보자

Input/Output by using Serial Class

❖ Experiment Sequence

- ① Write Sketch code using Serial print/write function and execute it
- ② Write Serial print Sketch with specifying the format and execute it
- ③ Write Serial Monitor Echo Back Sketch and execute it
- ④ Check the Result

① Serial print/write Sketch

1. Create new file (Ctrl+N) named as follows

- LAB₂_{_}₁_{_}{ID} : e.g. If ID is 201724500, file name is LAB₂_{_}₁_{_}201724500

The screenshot shows the Arduino IDE interface. The title bar reads "LAB2_2_1_201724500 | 아두이노 1.8.5". The menu bar includes "파일 편집 스케치 둘 도움말". Below the menu is a toolbar with various icons. The main code editor window displays the following code:

```

LAB2_2_1_201724500 §

void setup() {
    // put your setup code here, to run once:
}

void loop() {
    // put your main code here, to run repeatedly:
}

```

A yellow box highlights the title bar and the tab bar where the file name is displayed.

2. Refer to the definition of print() and write() at [Arduino Serial Class Reference](#)

▪ Serial.print(val) / Serial.print(val, format)

- Prints data to the serial port as human-readable ASCII text. This command can take many forms. Numbers are printed using an ASCII character for each digit. Floats are similarly printed as ASCII digits, defaulting to two decimal places. Bytes are sent as a single character. Characters and strings are sent as is.

- Serial.print(78) gives "78"
- Serial.print(1.23456) gives "1.23"
- Serial.print('N') gives "N"
- Serial.print("Hello world.") gives "Hello world."

▪ Serial.write(val) / Serial.write(str)

- Writes binary data to the serial port. This data is sent as a byte or series of bytes; to send the characters representing the digits of a number use the print() function instead.

① Serial print/write Sketch

- 3. Input Sketch 4-1 code in page 68 of the textbook, then compile & upload**

LAB2_2_1_201724500

```
void setup() {
    // put your setup code here, to run once:
    Serial.begin(9600);
}

void loop() {
    // put your main code here, to run repeatedly:
    Serial.print("String :");
    Serial.println("Test String");
    Serial.print("Char : ");
    Serial.println('c');
    Serial.print("Integer : ");
    Serial.println(123);
    Serial.print("Float : ");
    Serial.println(3.14);

    byte data = 65;
    Serial.println();
    Serial.print("With print : ");
    Serial.println(data);

    Serial.print("With write : ");
    Serial.write(data);

    while (true);
}
```

- 4. Check the output on Serial Monitor and compare them with Sketch code**

- What's the difference between print() and println()?
- What's the difference between print() and write()?
- What does byte mean in 'byte data = 65;'
 - Which data types are supported in Arduino ?

COM3 (Arduino/Genuino Mega or Mega 2560)

String :Test String
Char : c
Integer : 123
Float : 3.14

With print : 65
With write : A

Decimal Hex Char

| | | |
|----|----|---|
| 64 | 40 | @ |
| 65 | 41 | A |
| 66 | 42 | B |
| 67 | 43 | C |
| 68 | 44 | D |

② Serial Print Sketch with Specifying the Format

1. Create new file (Ctrl+N) named as follows

➤ LAB2_2_2{ID}

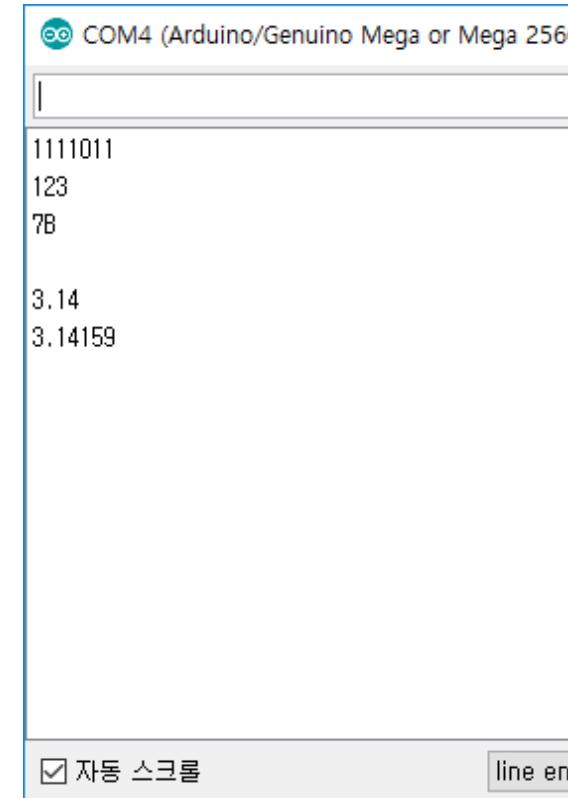

2. Refer the meaning of 2nd parameter of print() at [Reference](#)

- An optional second parameter specifies the base (format) to use; permitted values are BIN(binary, or base 2), OCT(octal, or base 8), DEC(decimal, or base 10), HEX(hexadecimal, or base 16). For floating point numbers, this parameter specifies the number of decimal places to use. For example-
 - Serial.print(78, BIN) gives "1001110"
 - Serial.print(78, OCT) gives "116"
 - Serial.print(78, DEC) gives "78"
 - Serial.print(78, HEX) gives "4E"
 - Serial.println(1.23456, 0) gives "1"
 - Serial.println(1.23456, 2) gives "1.23"
 - Serial.println(1.23456, 4) gives "1.2346"

② Serial Print Sketch with Specifying the Format

- Input the Sketch 4-2 code on page 70 of the Textbook, then compile & upload

```
void loop() {  
    int n = 123;  
    float f = 3.1415927;  
  
    Serial.println(n, BIN); //이진수  
    Serial.println(n, DEC); //십진수, 디폴트값으로 DEC는 생략 가능  
    Serial.println(n, HEX); //십육진수  
  
    Serial.println();  
    Serial.println(f);  
    Serial.println(f, 5);  
  
    while (true);  
}
```

③ Serial Monitor Echo Back Sketch

1. Create new file (Ctrl+N) named as follows

➤ LAB_{2_2_3}{ID}

2. Refer the definition of available(), peek(), read() at [Reference](#)

- Serial.available(void)
 - Get the number of bytes (characters) available for reading from the serial port. This is data that's already arrived and stored in the serial receive buffer (which holds 64 bytes). available() inherits from the Stream utility class
- Serial.read(void)
 - Reads incoming serial data. read() inherits from the Stream utility class.
 - **Removing data from the internal serial buffer** after reading.
- Serial.peek(void)
 - Returns the next byte (character) of incoming serial data **without removing it from the internal serial buffer**. That is, successive calls to peek() will return the same character, as will the next call to read(). peek() inherits from the Stream utility class.

③ Serial Monitor Echo Back Sketch

- Input the Sketch 4-3 code in page 72 of the Textbook, then Compile & Upload

```
void loop() {
    if (Serial.available() > 0) { // 수신된 데이터 존재 여부 확인
        byte data = Serial.read(); // 바이트 단위로 읽기

        Serial.print("Echo back : ");
        Serial.write(data); // 문자 출력
        Serial.print(" ");
        Serial.println(data); // ASCII 값 출력
    }
}
```

COM4 (Arduino/Genuino Mega or Mega 2560)

Echo back : t 116
Echo back : e 101
Echo back : s 115
Echo back : t 116

Serial Monitor

④ Check the Result (by TA)

1. Show the three Sketch code you have written
2. Show the result of LAB 2-2-3 Sketch on Serial Monitor
3. Answer TA's questions about Sketch code

LAB2_2_1_201724500 | 아두이노 1.8.5

```
파일 편집 스케치 틀 도움말

LAB2_2_1_201724500

void setup() {
    // put your setup code here, to run once:
    Serial.begin(9600);
}

void loop() {
    // put your main code here, to run repeatedly:
    Serial.print("String : ");
    Serial.println("Test String");

    Serial.print("Char : ");
    Serial.println('c');

    업로드 완료.

스케이저는 뜨거운 서상 공간 2220 바이트(0%)를 사용, 쇠대 25395
전역 변수는 동적 메모리 262바이트(3%)를 사용, 7930바이트의 지역
```

25 Arduino/Genuino Mega or Mega 2560, ATmega2560 (Mega 2560) on COM5

LAB2_2_2_201724500 | 아두이노 1.8.5

```
파일 편집 스케치 틀 도움말

LAB2_2_2_201724500

// put your main code here, to run repeatedly:
int n=123;
float f=3.1415927;

Serial.println(n, BIN);
Serial.println(n, DEC);
Serial.println(n, HEX);

Serial.println();
Serial.println(f);
Serial.println(f,5);

while (true);

업로드 완료.

스케이저는 뜨거운 서상 공간 3262 바이트(1%)를 사용, 쇠대 25395
전역 변수는 동적 메모리 188바이트(2%)를 사용, 8004바이트의 지역
```

19 Arduino/Genuino Mega or Mega 2560, ATmega2560 (Mega 2560) on COM5

LAB2_2_3_201724500 | 아두이노 1.8.5

```
파일 편집 스케치 틀 도움말

LAB2_2_3_201724500

void loop() {
    // put your main code here, to run repeatedly:
    if (Serial.available() > 0) {
        byte data = Serial.read();

        Serial.print("Echo back :");
        Serial.write(data);
        Serial.print(" ");
        Serial.println(data);
    }
}

업로드 완료.

스케이저는 뜨거운 서상 공간 1996 바이트(0%)를 사용, 쇠대 25395
전역 변수는 동적 메모리 202바이트(2%)를 사용, 7990바이트의 지역
```

8 Arduino/Genuino Mega or Mega 2560, ATmega2560 (Mega 2560) on COM5

How to Upload the Video Clips of Experiments

❖ Practice for uploading the Video Clips of Experiments

- In this class, usually you have to make video clips showing the experiment results and submit them
- This practice shows how to submit your video clips of experiment results by using Google Photo
 - This practice just considers unfamiliar students to smartphone or computer. If you don't want to use Google Photo, You can use any other ways to submit your handin.

❖ Experiment Sequence

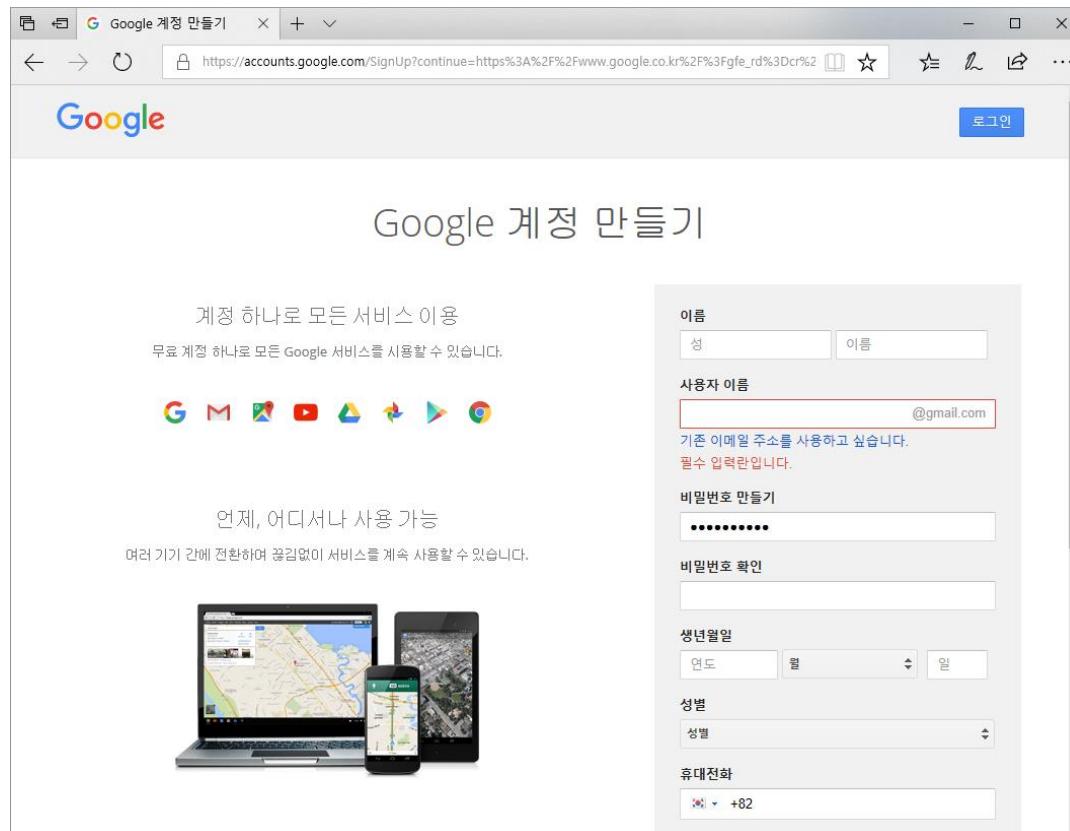

- ① Create Google account, Install Google Photo APP
- ② Make a Video of Blink Experiment by using a Smartphone
- ③ Google Photo Upload by using a Smartphone
- ④ Sharing a Video Clip Link in Google Photo Site
- ⑤ Create Hyperlink of Video Clip in PLATO

① Create Google account, Install Google Photo APP

❖ If you don't have a Google account, create a new account

- or if you have, just use it

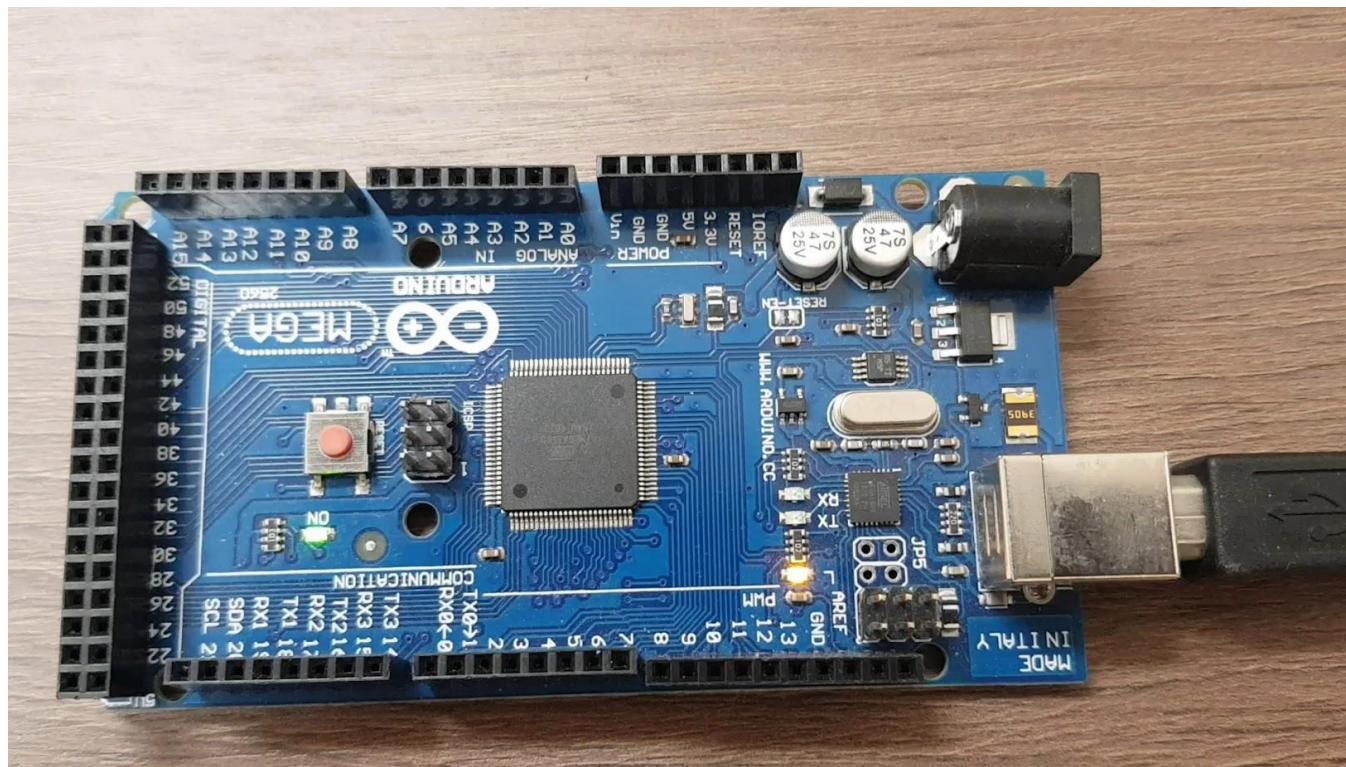

❖ Install Google Photo APP on your own smartphone

Google Photos

② Make a Video of Blink Expt. by using Smartphone

1. Upload Blink Sketch of LAB 2-1 to Arduino
2. Make a video showing LED blinking by using a smartphone

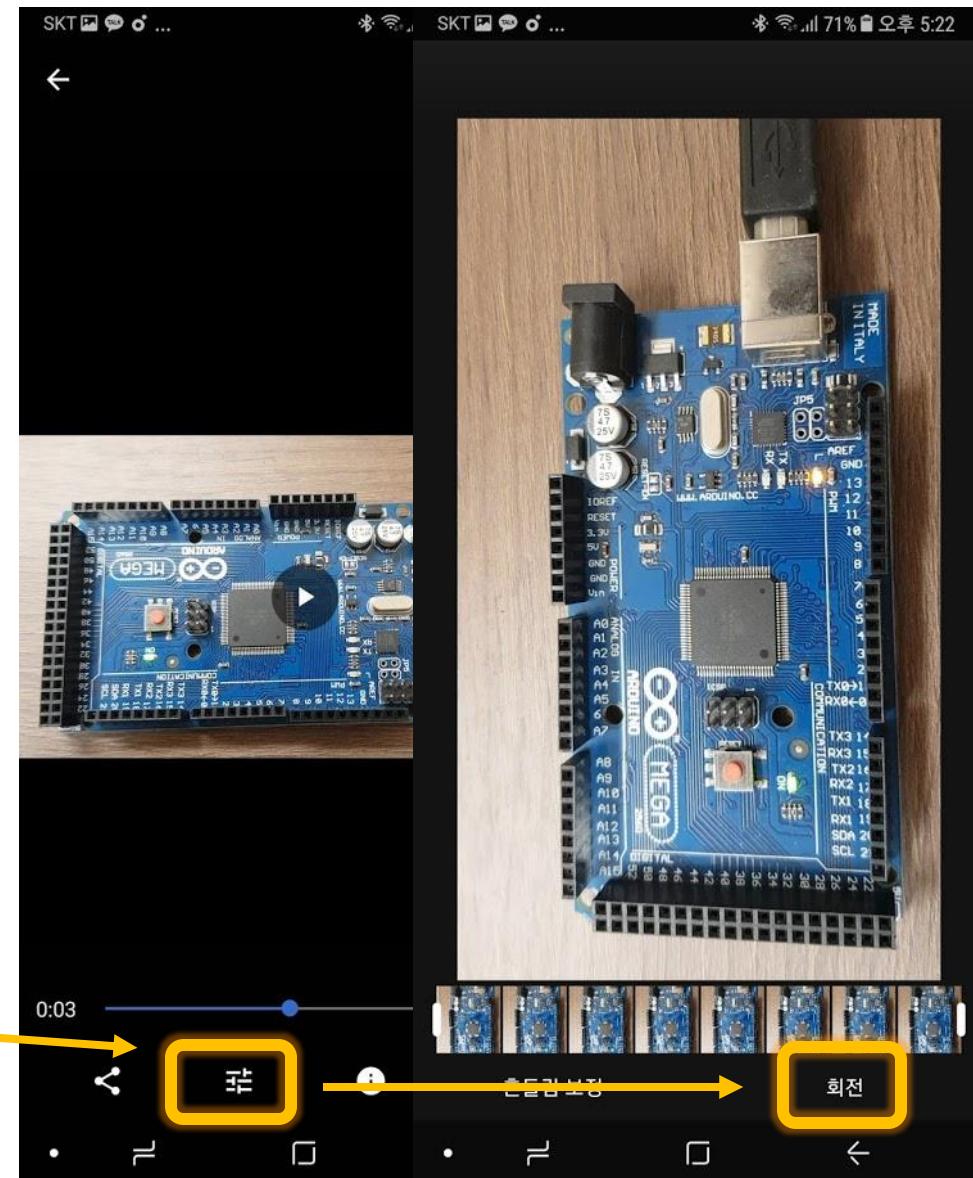

③ Google Photo Upload by using Smartphone

1. Check the video clip in Google Photo App

- Video clips are automatically Uploaded / Backed up to the Cloud. But it could require a Wi-Fi connection due to configuration. In this case, you can backup a video clip after selecting it explicitly.

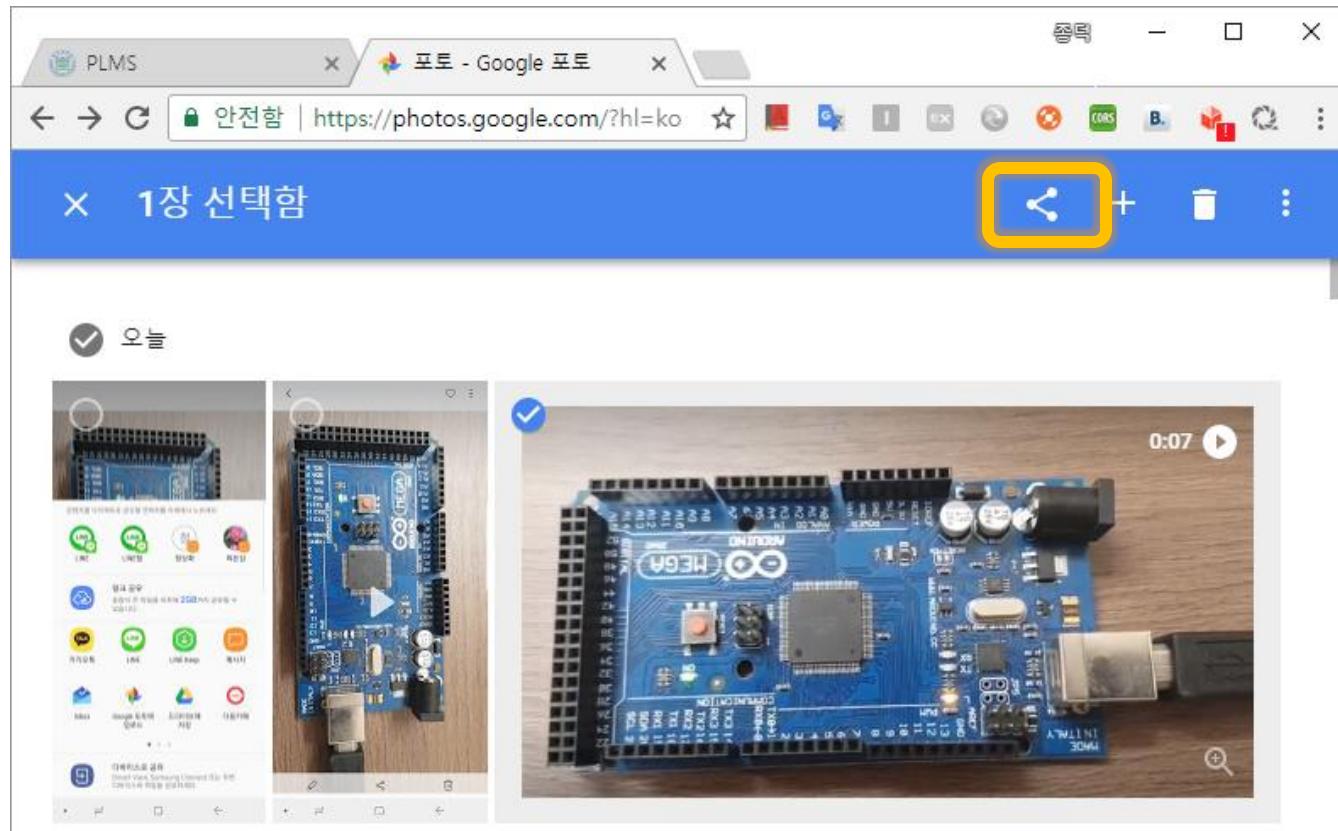

2. If necessary, rotate a video before uploading

- Sometimes, a video clip is saved in vertical mode even if you make a video horizontally. In this case, you can rotate the video clip by using editing mode of Google Photo.
- Pause → Edit → Rotate

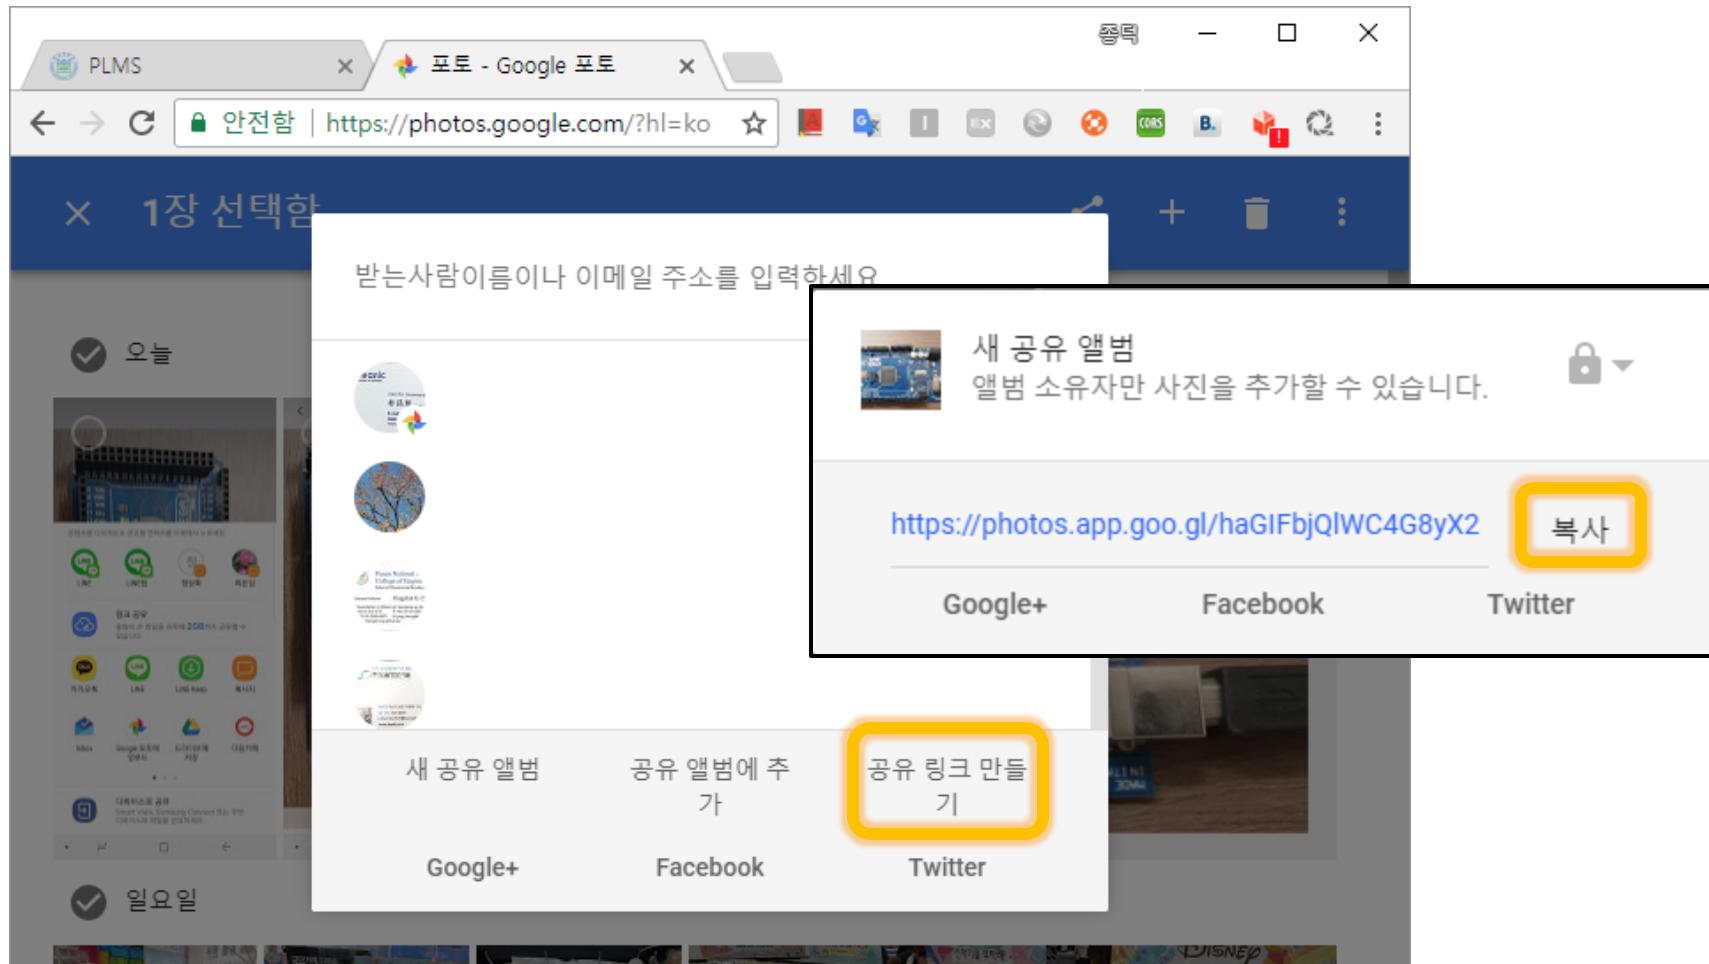

④ Sharing a Video Clip Link in Google Photo Site

- ❖ Check the video you have uploaded at <https://photos.google.com/>
 - If you can't, redo previous step ③
- ❖ Select the video clip for submitting, then click the sharing button

④ Sharing a Video Clip Link in Google Photo Site

- ❖ Click '공유 링크 만들기', then copy the Link URL

⑤ Create a Hyperlink of Video Clip in PLATO

- ❖ Insert “{ID} LAB 2-3 Video Link” in PLATO LAB 2-3. Select the string you have inserted, then click the ‘Create Link’ button.

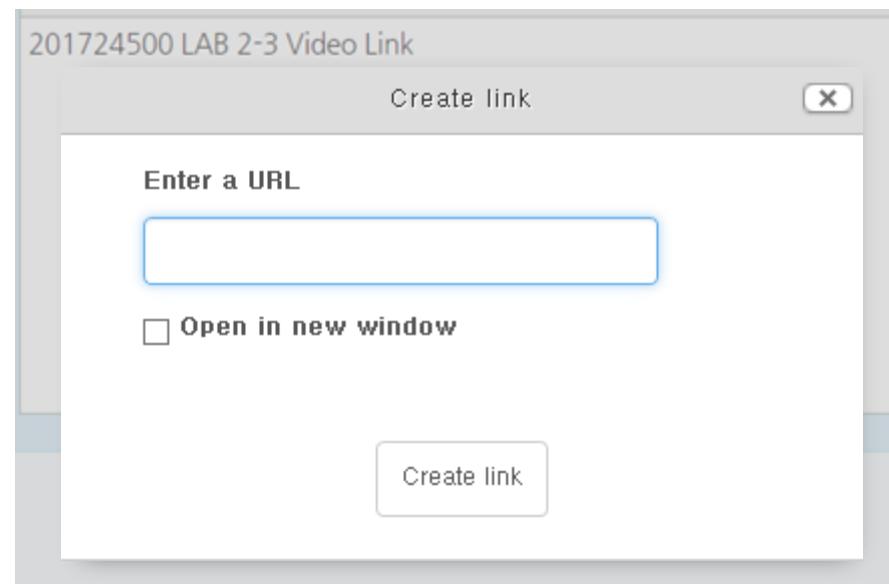

The screenshot shows the PLATO LAB 2-3 interface. On the left, there is a sidebar with the following information:

- 문제 3
- 아직 답하지 않음
- 총 4.00 점
- ▶ 문제 표시
- ⚙ 질문 편집

The main area has a light blue background with the text "Submit a video link of your LAB 2-3 result." Below this is a toolbar with various icons. A yellow box highlights the text "201724500 LAB 2-3 Video Link". To the right of this text is a button labeled "하이퍼링크 삽입" (Insert Hyperlink). A yellow circle highlights the "Create Link" icon in the toolbar, which is a chain symbol. A larger yellow box highlights the "Create link" button in a modal window that appears when the "Create Link" icon is clicked.

- ❖ Paste Link URL you have copied in previous step ④ with Ctrl-C.

- Check ‘Open in new window’

⑤ Create a Hyperlink of Video Clip in PLATO

- ❖ Before final submission, please check if the video link is created correctly by right click on the link.

Submit a video link of your LAB 2-3 result.

The screenshot shows a web browser window with a video player. The video player displays a blue Arduino Uno microcontroller connected to a USB cable. The browser's address bar shows a Google Photos URL: <https://photos.google.com/share/AF1QjOOGXWzJ...>. A context menu is open over the video player, with the first item highlighted in yellow: "새 탭에서 링크 열기(T)". Other menu items include "새 창에서 링크 열기(W)", "시크릿 창에서 링크 열기(G)", "다른 이름으로 링크 저장(K)...", "링크 주소 복사(E)", "잘라내기(T)" (with Ctrl+X), "복사(C)" (with Ctrl+C), "붙여넣기(P)" (with Ctrl+V), "일반 텍스트로 붙여넣기" (with Ctrl+Shift+V), "전체 선택(A)" (with Ctrl+A), "맞춤법 검사(S)", and "쓰기 방향".

Homework

❖ Write a Sketch code that reads two integer inputs from Serial Monitor, then print out the sum of them to Serial Monitor.

- Refer ParseInt() of Serial Class for integer input.
- Before entering integer input, print out the message that requires entering integers.
 - e.g.) "Enter 2 Integers to add"
- How to enter interger inputs from Serial Monitor.
 - Your Sketch has to support two different way for entering inputs. The first way is pushing the 'Send' button for every single integer input. Second is pushing the button only once after entering two integer inputs together. (Each input should be splitted by space.)
- Your Sketch has to perform the operation described above repeatedly.
 - If the Sketch code performs only once, you will get some penalty.

❖ Submission

- Submit your handin through HW2 in PLATO.
 1. Insert your Sketch code.
 2. Upload an image capturing the Serial Monitor

❖ e.g.)

 COM5 (Arduino/Genuino Mega or Mega 2560)

11

Enter 2 Integers to add

23 + 34 = 57

Enter 2 Integers to add

175 + 10 = 185

Enter 2 Integers to add

HW.2 Submission Example

- ❖ As you can see the following figures, Please submit both your code and capture images

Refer the lecture slide for the details.

직접 작성

```
// HW2 - 201724500
int nState = 1;
```

COM5 (Arduino/Genuino Mega or Mega 2560)

11

Enter 2 Integers to add
23 + 34 = 57

Enter 2 Integers to add
175 + 10 = 185

Enter 2 Integers to add

```
// HW2 - 201724500
int nState = 1;
int num1, num2, sum;
void setup() {
    // put your setup code here, to run once:
    Serial.begin(9600);
}
```
